

Exploring Qubic: A Distinctive Cryptocurrency Ecosystem

Introducing Qubic, a forward-thinking cryptocurrency platform that sets itself apart from traditional blockchain solutions. Conceived by Sergey Ivancheglo, the brain behind IOTA and NXT, Qubic weaves together a distributed ledger system with smart contract capabilities, offering features like seamless microtransactions. While it brings significant innovations to the table, it's crucial to focus on its unique aspects, particularly in terms of tokenomics and technological application.

Cryptocurrency Transaction Fees: How They Work and How to Minimize Them

Transaction fees in the world of cryptocurrencies are directed towards miners who verify or add the transaction to the blockchain. Once a transaction is stored within the blockchain network, it is considered confirmed. Transaction fees can vary over...

Bitcoin halving

Days: 130 : Hours: 08 : Minutes: 49 : Seconds: 36

Halving is a unique mechanism used in cryptocurrencies like Bitcoin to limit the number of coins in the market, potentially increasing their value. During a halving event, the reward for miners is halved. This process repeats at regular intervals - for Bitcoin, every 210,000 blocks. The next Bitcoin halving is anticipated to occur around April 12, 2024, when the reward for miners will decrease from 6.25 BTC to 3.125 BTC, happening at the mining of block number 840,000. The exact date and time of the halving are not fixed, as they depend on the speed of block mining. Halving is not exclusive to Bitcoin and also affects other cryptocurrencies like Litecoin, Bitcoin Cash, and Ravencoin.
